Functions of network interface card pdf

I'm not robot!

In order to continue enjoying our site, we ask that you confirm your identity as a human. Thank you very much for your cooperation. A network interface card (NIC or network adapter) is an important hardware component used to provide network connections for devices like computers, servers, etc. With its wide applications, there are various types of network interface cards emerging in the market like PCIe card and server network card. In this post, we will have a full exploration of this hardware component from what is a network interface card to its function, components, and types. What Is a Network Interface Card? Network interface card, also known as NIC or network interface controller, is typically a circuit board that installed on the computer to connect to the network. It works as an indispensable component for the network connection of computers. Currently, NIC cards designed as a built-in style are commonly found in most computers and some network servers. Besides, network cards like server network card can also be inserted into expansion slots of devices. What Is the Function of Network Interface Card? NIC definition is very simple, but what does a network interface card do and what is the function of NIC? Working as an interface at the TCP/IP layer, a NIC card can transmit signals at the physical layer and deliver data packets at the network layer. No matter what layer the network interface controller lies, it acts as a middleman between a computer/server and a data network. When a user requests a web page, the LAN card gets data from the user device, and sends them to the server on the internet, then receives the required data back from the Internet to display for users. Components of Network Interface Card Conventionally, a network adapter mainly consists of a controller, boot ROM socket, one or several NIC ports, a motherboard connection interface, LED indicators, a profile bracket, and some other electronic components. Every component of a LAN card has its unique function: Controller: The controller is like a mini CPU, processing data received. As a core part of a network adapter, the controller directly decides the performance of the network adapter. Boot ROM socket: This socket on the card enables boot ROM capability. Boot ROM allows diskless workstations to connect to the network, increasing security and lowering the cost of hardware. NIC port for cable/transceiver: Usually, this port will connect with an Ethernet cable or transceiver directly, which can generate and receive the electronic signals that are put on the network cable or fiber cable. Bus interface: This interface is on the side of the circuit board, which serves for the connection between the NIC and computer or server via being plugged into their expansion slot. LED indicators: Indicators are used to help users to identify the working status of a network card whether the network is connected and data transmitted. Profile bracket: There are two types of profile brackets in the market. One is called the full-height bracket with a length of 12 cm, and the other is the low-profile bracket with a length of 8 cm. This bracket can help users fix the NIC in the expansion slot of a computer or server. Types of Network Interface Card The network interface cards can be classified into different types on the basis of different features like host interface, transmission speed and application fields. The following part gives the details. Network Connection Based Classifications Based on the way a network card accessing the network, there are wired NIC and wireless NIC. As the name shows, a wired NIC usually has to connect a node onto a network with a cable like Ethernet cable and fiber optic cable. A wireless NIC card often comes with a small antenna, which uses radio waves to communicate with the access point to get involved in a wireless network. Bus Interfaces Based Classifications ISA (Industry Standard Architecture) network card: ISA bus was developed in 1981, which was a standard bus architecture for IBM compatibles. Due to the low card speed of 9Mbps, the ISA bus interface now is no longer a recognized type, and it’s hard to find it in today’s stores. PCI (Peripheral Component Interconnect) network card: PCI bus was developed in 1990 to replace the previous ISA standard. It has a fixed width of 32 bit (133MB/s transmission data) and 64 bit (266MB/s transmission data). This type of NIC card was first used in servers and later on gradually applied to PCs. Today, most PCs do not have expansion cards, but rather devices integrated into the motherboard. As a result, PCI network card has been replaced by other bus interfaces, like PCI-X or USB interface. PCI-X (Peripheral Component Interconnect eXtended) network card: PCI-X is an enhanced PCI bus technology. It operates at 64 bit and is capable of up to 1064 MB/s. In many cases, PCI-X is backward compatible with PCI NIC cards. PCIe (Peripheral Component Interconnect Express) network card: PCIe is the latest standard and now is popular on computer and server motherboards. PCIe NIC card is available in five versions now, and each version supports five types of lanes at different speeds. Learn more about PCIe network card, read the post: What Is PCIe Card? Everything You Need to Know About PCI Express Card. PCIe Version Line Code x1 x2 x4 x8 x16 1.0 8b/10b 250MB/s 0.50GB/s 1.0GB/s 2.0GB/s 4.0GB/s 2.0 8b/10b 500MB/s 1.0GB/s 2.0GB/s 4.0GB/s 8.0GB/s 3.0 128b/130b 984.6MB/s 1.97GB/s 3.94GB/s 7.88GB/s 15.8GB/s 4.0 128b/130b 1969MB/s 3.94GB/s 7.88GB/s 15.75GB/s 31.5GB/s 5.0 128b/130b 3938MB/s 6.15GB/s 12.3GB/s 24.6GB/s 63.02GB/s USB (Universal Serial Bus) network interface card: USB bus is an external bus standard. It has three versions with different data rates and can work together with a variety of devices. In addition, the wireless network card is also a type of NIC card, which is designed for Wi-Fi connection. Port Type Based Classifications According to different cables connected, four types of NIC ports can be found in the market. RJ-45 port is used to connect with twisted pair cable (like Cat5 and Cat6), AUI port used for thick coaxial cable (like AUI transceiver cable), BNC port for thin coaxial cable (like BNC cable), and optical port for transceiver (like 10G/25G transceiver). Transmission Speed Based Classifications Based on different speeds, there are 10Mbps, 100Mbps, 10/100Mbps adaptive card, 1000Mbps, 10GbE, 25G or even higher speed network cards on the market. 10Mbps, 100Mbps and 10/100Mbps adaptive NIC cards are suitable for small LAN, home uses or day-to-day offices. 1000Mbps NIC provides a higher bandwidth in the Gigabit network. As for the 10Gb/25Gb NIC or even higher speed NIC cards, they are welcomed by the large enterprises or data centers. To know more about 25G NIC, you can read this post: 25G NIC - the Highly Effective Path Towards 100G Network. Application Fields Based Classifications Computer NIC card: Today, most new computers have the NIC built into the motherboard, so a separate LAN card is not needed. It commonly comes with 10/100Mbps, and 1Gbps speed, and allows one PC to communicate with other PCs or networks. Server network card: The main function of a server network card is to manage and handle network traffic. Compared with the ordinary PC network adapter, server adapters usually requires faster data transmission speed like 10G, 25G, 40G, and even 100G. Plus, server adapters have low CPU occupancy rate, since it has a special network controller that can take many tasks from CPU. To meet users’ different speed demands of server adapters, FS has released 10G PCIe adapters and 25G/40G NIC cards. Built with the Intel controller, those PCIe adapters support multi-core processors and optimization for server and network virtualization. Conclusion The performance of the NIC card directly affects the data transfer rate of the overall network. Whether you are looking for network adapters for home uses, or a server network card for SMB or data centers, it’s necessary to understand what is a network interface card, component and function of NIC as well as types of NIC before purchasing a network interface card. To know more about how to buy a network card, you can read this post: How to Choose a Network Card?. Network Interface Card (NIC) is a hardware unit, which is inbuilt inside a computer provided with a slot, it connects the computer to a computer network for communication with other devices via buses. There are many synonyms for network interface card like, network adapter, local area network (LAN) card or physical network interface card, ethernet controller or ethernet adapter, network controller, and connection card. Network interface card supports almost all standard buses for data transfer between the computers or devices. The connectors or buses act as an intermediator for communication converts the communication between various devices from serial communication to parallel communication or parallel communication to serial communication. It also formats data based on the architecture of the network. This article discusses an overview of What is a wireless network interface card, and its types. What is a Network Interface Card? Definition: Network interface card NIC is a hardware component, where network controllers are integrated on to a circuit board that uses standard OSI model of 7 layers to communicate and it acts like a trans-receiver, where it can transmit and receives at the same time while communicating with other devices. Suppose if we want to communicate with another device, let us assume the case of client and server, where the communication between them takes place by firstly sending signals to the physical layer, and then transmitting data packets to the network layer which is an interface at TCP/IP. Connection to the motherboard is made using any one of the following via PCI connector ISA connector ISA connector PCI-E FireWire USB Thunderbolt. The connection to the network is made via any one of the following Ethernet Wi-Fi Token – Ring ATM Functions of NIC It acts like a translator, which converts data into a digital signal. Communication can be either by using cable wire or by the router which is wireless over the server network To communicate over a long distance a network adapter is used. Types of Network Interface Cards There are two types NIC they are, Ethernet NIC Wireless Network NIC Ethernet NIC Ethernet NIC card is a slot for a cable where we have to plug one end of the ethernet cable into the slots of the computer and another end of the cable is plugged into the modem, likewise, various devices are connected to make a communication set up between them. There are three standards in Ethernet they are 5-Base T: It was developed in 1973, which can transmit, paragraphs using coaxial cable up to a distance 1000mts. 10-Base T: It was developed in 1987, it uses twisted cables like telephonic cables for communication. 100-Base T: It is also known as fast ethernet, the speed of data transmitted is very high. Gigabit Ethernet: It is also named as 1000-Base T ethernet, the special feature of this is it increases the network bandwidth up to 10 times, which can transmit up to 1000mbps of data. wired-network-interface-card Wireless Network NIC Wireless network NIC cards consist of a small antenna integrated onto the card, where the communication between various devices is set up wirelessly using the router and various network protocols. One such example of a wireless network NIC card is fiber data digital interface FDDI. In a case where data has to be transmitted over long distances, in such cases, a fiber data digital interface FDDI concept is used which translates data into digital pulses and communicates using optical fiber. FDDI is ring-type architecture, which is of 100mbps, transmission, and retransmission for a long distance is an advantage of FDDI. wireless-network-interface-card Components of Network Interface Card The main components of the Network Interface Card are as follows An external Memory is used to store the data temporarily and uses the stored data whenever required while processing the communication. Connectors are used to make the physical link between cables and plugin with the board, this type of connection is especially seen in Ethernet type of NIC cables. A Processor converts the data message into a signal format for communication to take place easily. Different types of standard Buses are plugged into Buses Connector slots, based on the compatibility of the operation process buses are chosen. Jumpers or Dual in package switches are used to control the communication operation, which is either by turning on or turning off the switch. MAC address which is a unique identity address is given to network interface card where ethernet packets are communicated with the computer. MAC address is also known as a physical network address. A router is an NIC device that is used to connect wirelessly to the internet. components-of-NIC Working of NIC The Functions of the network interface card is, it acts like a bridge connecting multiple computers using LAN – local area network or router, which is plugged into the NIC card slot. Considering a live scenario of corporate offices, for a better understanding of the concept. In a company there may be many computers provided with WiFi access, where each employee is assigned with one computer to work when the employee wants to access the company website to update his day to day work status, he is provided with his login credentials. He can only log in to his profile based on two scenarios, one is a proper internet connection which can be either wired or wireless connection and other correct login credentials. Here come a few questions about network interface card NIC concept that is, how the network is connected and how data transfer takes place? example – of – network – interface – card These computers which are connected to NIC communicate over the internet where the incoming data travels along the media is received by NIC. These bits which are received formatted into frames, CRC (cyclic redundant code) is compared with CRC (cyclic redundant code) in the frame trailer and calculated using CRC (cyclic redundant code) algorithm. If CRC (cyclic redundant code) doesn’t match it means the frame is damaged/changed and it is discarded. This kind of situation is rarely observed in an electrically noisy environment. Another case where if the CRC (cyclic redundant code) is ok, the destination MAC address is checked, if it is matching the network interface card of the broadcast frame, then the frame is processed forward else discarded. Once the MAC address is verified, the frame header and trailer are stripped creating a packet that is transmitted using network protocols for further processing. This is the actual job of NIC in one direction. Now for an out-going data, the reverse process is used. The network protocol transfers a packet to the NIC. The NIC adds the source and destination MAC address as the frame header and calculates the CRC for the trailer. Now the frame is ready to transmit. The NIC converts the frame for transmission onto the medium as bit signals. Advantages The advantages of the Network Interface Card are as follows The communication speed using the Internet is high usually in Gigabytes Highly reliable connection Many peripheral devices can be connected using many ports of NIC cards. Bulk data can be shared among many users. Disadvantages The disadvantages of Network Interface Card are as follows Inconvenient in case of wired cable NIC, as it is not portable like a wireless router The configuration should be proper for better communication. Data is unsecured. Applications The applications of Network Interface Card are as follows The computer uses NIC for data exchange over a network like documents, images, files, etc. Applicable for wireless communication devices like Firewalls, Bridges, Repeater. Applicable for wired communication devices hubs, switches, router, smartphones, etc. Thus, this article briefs out about network interface card or network interface controller which is an electronic hardware component integrated with computers. The main purpose of this is to communicate with other devices either wired or wirelessly. In this article, we have seen types of NIC, it’s working with an example, advantages, disadvantages, and applications. The main vendors of network interface cards are Intel, Cisco, D-Link, etc. Here is a question “Which type of Network Interface Card is used in Smartphones?”.
